

POTATOFOG

DRY MIST GIVES THE BEST RESULTS, TO PROTECT YOUR POTATOES

Dry mist gives the best results

The Potatofog system is specially developed for fogging sprout inhibitors or other additives to provide a complete object or surface treatment. The guaranteed average droplet size smaller than 10 micron makes sure that every part of the potato storage is treated evenly. The robust design of the nozzle, with chemical resist hoses and stainless steel parts, provide you with a problem-free and reliable system that allows high quality inhibition time after time.

The nozzle is designed to create a dry mist. This way surfaces stay dry, but can still be treated with the inhibitor in the mist. This makes the Potatofog a good choice for a variety of uses besides potato fogging. Like disinfecting instruments and lorries.

Depending on the options on your fogger, your product may look different from the image.

FOGGING & HYGIENE

POTATOFOG

DRY MIST GIVES THE BEST RESULTS, TO PROTECT YOUR POTATOES

Specifications

- **Specially designed for fogging sprout inhibitors during the storage of potatoes**
- Uses compressed air (3.5 bar) for operation. Can be easily connected to your compressor (150 l / min / 1 nozzle)
- Guaranteed droplet size of $< 9 \mu\text{m}$ (certified droplet size measurement available)
- Available as mobile hand unit or completely integrated system with multiple nozzles
- Automatic or manual control
- Controls of device can be connected to the storage computer
- Easy to use and low maintenance
- Suction height of the fluid is 60 cm (no pump)

Capacity

2,5 litres/hour.

Tank size

n/a.

Air throw

n/a.

Power

3.3 bar.

Droplet size

5 - 10 μm .

Mobility

Portable or to be used as fixed installation.
